

ASSIGNMENT-3

1. HTML frames are used to divide your browser window into multiple sections where each section can load a separate HTML document. A collection of frames in the browser window is known as a frameset. The window is divided into frames in a similar way the tables are organized: into rows and columns.

- 1.1 Create a webpage that will divide your web-page into three horizontal frames and load html document in each frame as shown below:

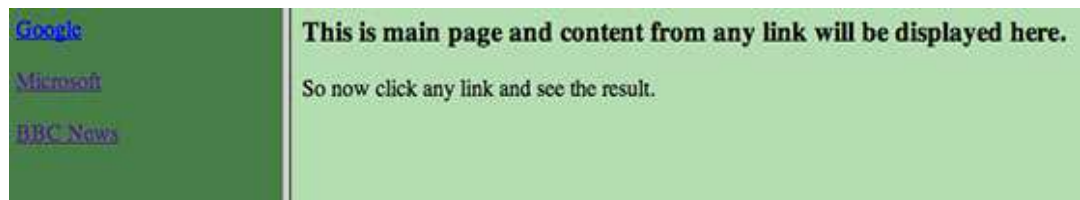

- 1.2 Create a webpage that will divide your web-page into three vertical frames and load html document in each frame as shown below:

- 1.3 One of the most popular uses of frames is to place navigation bars in one frame and then load main pages into a separate frame. First

create two columns to fill with two frames. The first frame is 200 pixels wide and will contain the navigation menubar implemented by **menu.html** file. The second column fills in remaining space and will contain the main part of the page and it is implemented by **main.html** file. For all the three links available in menubar, mention target frame as `main_page`, so whenever you click any of the links in menubar, available link will open in `main_page`.

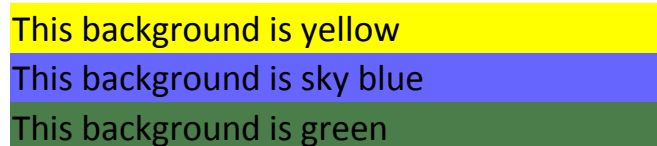

2. HTML Layouts

- The HTML `div` tag is used for defining a section of your document. With the `div` tag, you can group large sections of HTML elements together and format them with CSS. Create the same page shown in 1.3 using the `<div>` tag.

3. HTML Background

- The **bgcolor** attribute is used to control the background of an HTML element, specifically page body and table backgrounds. Create a web-page containing three tables as shown below. For first table use “**Color Name**” to fill color. For second table use “**Hex Value**” to fill color. For third table use “**Color values in RGB terms**” to fill color.

4. HTML Marquees

- An HTML marquee is a scrolling piece of text displayed either horizontally across or vertically down your webpage depending on the settings. This is created by using HTML <marquees> tag.
- Display some text on web-page that will move from left to right ,right to left and bottom to top.
- You have to use various attributes of marquee tag like “width, height, delay, scrolldelay, scrollamount, loop, hspace and vspace”.
- Check the same results by using some images.
